

“*Mr Nowak, who is GMC registered, says: “I am very pleased to be offering UK patients with more treatment options for foot and ankle conditions. I have a successful practice in Germany and am looking forward to UK patients benefiting from my clinical expertise.”*

Mr Nowak offers a ‘micro invasive’ bunion procedure, which was created by an Austrian surgeon. This is different to minimally invasive procedures as it only requires one small incision, requires no screws, has very low risk of infection and a fast recovery period.

“*Mr Nowak explains: “This outpatient procedure makes a sculptural 3D shift of the metatarsal bone and big toe, improving both the look and function dramatically. It allows for immediate walking with full weight-bearing and providing the surgeon’s orders are followed, the patient should be able to slip back into normal shoes within two months.”*
